

However, the literature did not focus on accurately identifying and redacting sensitive information across diverse contexts. Current solutions largely rely on generalized datasets and models that are primarily optimized for regions such as ██████████ and ██████████ leading to inconsistencies and biases in detecting Personally Identifiable Information (PII), especially names and identifiers ██████████ regions, ██████████ which shows significant improvement in different areas. to expand across sectors like government, healthcare, and finance, the risk of ██████████ due to inefficient redaction tools becomes ██████████ which are largely optimized for regions such as ██████████ and ██████████ fail to effectively recognize ██████████ resulting in inaccuracies and bias. By incorporating ██████████ context-aware models, the proposed system will improve the detection and redaction of sensitive information such as Nigerian names with National Identification Number (NIN) of ██████████ and Social Security Number of ██████████

This project focuses on the design and implementation of a smart ██████████ tool tailored to detect and redact sensitive information specific to underrepresented regions, ██████████ The system will process digital text-based documents such as PDF and Word files ██████████ Number of ██████████ and address location of House ██████████ Alao-Akala Way, Akobo, ██████████ State, ██████████

The modified system will be implemented as a desktop (PC-based) application, enabling users to locally upload and process documents without reliance on ██████████ Performance evaluation will be conducted based on detection accuracy, processing efficiency, and the system’s effectiveness in ██████████ compared to existing generic redaction tools.

NAME	BVN	NIN	Voter Registration Number
Oladele Peter	██████████	██████████	██████████
██████████	██████████	██████████	██████████
██████████	██████████	██████████	██████████
